

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is actually a tool constructed out of top quality materials designed to withstand the most demanding operations and work environments. This particular piece of equipment can enable the person driving to be able to maneuver the forks hydraulically without leaving the seat. Side shifting models have the added ability to laterally position the entire load or the arms so as to facilitate more exact lifting and placement in a faster and more efficient way.

The unique blade pocket design can enable the one operating it to be able to securely swing the unit's blades without any worry of destroying the positioning cylinders. This can allow the worker the alternative to either execute independent or simultaneous blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are required. Standard OEM carriages could be transformed into fork positioners on existing units.
